Thank you for purchasing an Olympus digital camera. Before you start to use your new camera, please read these instructions carefully to enjoy optimum performance and a longer service life. Keep this manual in a safe place for future reference.

We recommend that you take test shots to get accustomed to your camera before taking important photographs.

In the interest of continually improving products, Olympus reserves the right to update or modify information contained in this manual.
How to use this manual

● Basic and Advanced Manuals
The instruction manual accompanying this camera is divided into two parts: the Basic Manual and the Advanced Manual (this document).

Basic Manual
This manual helps you get used to the camera. It gives you easy-to-follow explanations on how to take pictures and view them.

Advanced Manual
This manual introduces you to the camera’s many functions after you have mastered the basics. It will help you to use the camera’s capabilities to take much more creative pictures, with more fun!

● Indications used in this manual
Below is an explanation of how to read the instructions in this manual. Please read it carefully before proceeding.

⚠️ Note
Important information on factors which may lead to a malfunction or operational problems. Also warns of operations that should be absolutely avoided.

Basic operation

Don’t you feel that although your camera has many attractive functions, you are unable to use them confidently? Now all you have to do is simply press the buttons on your digital camera. By setting the menus, you can easily do things like change where the light is metered or adjust the coloration of your picture. Just display a menu on the monitor and use the buttons to choose a setting. Familiarize yourself with the buttons and menus before reading the explanations of the various functions.

How to use the shooting button and playback button

This camera features a shooting mode and a playback mode. Shooting mode is for taking pictures and making shooting settings, whereas playback mode is for displaying pictures you have taken. To switch between the two modes, use $\#$ and $. Press $\#$ on its own, to turn the camera on in playback mode.

- Turning the camera on in shooting mode

Press the POWER switch.

- The camera turns on in shooting mode. You are ready to take pictures.

To turn the camera off
→ Press the POWER switch. The lens retracts, and the monitor turns off.

To enable playback mode
→ Press $. The lens remains extended, and playback mode is enabled. Press $\#$ to return to shooting mode.
How to use the shooting button and playback button

1 Turning the camera on in playback mode

With the camera off, press $azer$.  

- The camera turns on in playback mode. The last picture taken is displayed on the monitor.

To turn the camera off

→ Press the POWER switch. Or else, press $azer$. The monitor turns off.

To enable shooting mode

→ Press $azer$. The lens extends, and shooting mode is enabled. Press $azer$ to return to playback mode. The lens remains extended.

Note

- When the power is turned on, sometimes the monitor flashes before displaying the picture. This is not a malfunction.

How to use the menus

1 Basic operation

Use the arrow pad and \( \text{Z} \) to select and set menu items. Follow the operation guide and arrows on the screen to select and make settings. This section explains how to use the menus.

Ex: Making the [ISO] setting

1. Set the mode dial to a mode other than \( \text{AUTO} \).
2. Press \( \text{Z} \) in shooting mode.
   • The top menu is displayed.
3. Press \( \text{D} \) to select [MODE MENU].

TIPS
• The [MEMORY] tab is displayed when using the internal memory and the [CARD] tab is displayed when a card is inserted in the camera.
• Menu items common to the setup menu and the mode menus (in shooting mode and playback mode) apply to the same setting, and the setting can be made from any mode.
• For details of menu items in shooting mode and playback mode, see “Menu list” (P. 139).

Using the menus

Use the arrow pad and \( \text{Z} \) to select and set menu items. Follow the operation guide and arrows on the screen to select and make settings. This section explains how to use the menus.
4 Press " " to select the [CAMERA] tab, and press ".
• Refer to the arrows on the screen to select a setting with the arrow pad.

5 Press " " to select [ISO], and press ".
• Refer to the arrows on the screen to select a setting with the arrow pad.
• Unavailable settings cannot be selected.

6 Press " " to select the ISO sensitivity from [AUTO], [50], [100], [200] and [400], and press ".
• Press " repeatedly to exit the menu.

Menu notation
In this manual, procedures for using the menus are expressed as follows.
• Ex: Steps 1 to 5 of making the [ISO] setting

Top menu ➤ [MODE MENU] ➤ [CAMERA] ➤ [ISO]
How to read the procedure pages

A sample of a procedure page is shown below explaining the notation. Look at it carefully before taking or viewing pictures.

- This indicates shooting mode or playback mode. Both modes can be used when both icons are shown. “How to use the shooting button and playback button” (P. 9), “Shooting mode/Playback mode notation” (P. 11)

- Select the menus in the order indicated by ▶.
  “Using the menus” (P. 19), “Menu notation” (P. 20)

- Procedures differ for AUTO mode.

- Available languages vary depending on the area where you purchased this camera. “Changing the display language” (P. 82)

---

### Selecting a power on screen (PW ON SETUP)

You can set a screen or sound that is played back when the camera is turned on. You can also register your favorite picture and display it on the screen. “Registering a power on screen (SCREEN SETUP)” (P. 83)

1. From [SCREEN], select [OFF], [1] or [2], and press .
   • OFF: No picture is displayed.
   • A picture is displayed.
   • The registered picture is displayed.
   • If there is no registered picture, nothing is displayed.

2. From [SOUND], select [OFF], [1] or [2], and press .
   • OFF: No startup sound is output.
   • 1/2: Startup sound is output.
   • The volume level is the same as that set.

---

### Recording movies

This function is for recording movies. These movies can be played back on the camera. Sound can also be recorded.

1. Decide the composition of the picture.
   - The remaining recording time in the internal memory or card is displayed on the monitor.
   - You can use the zoom button to enlarge your subject.

2. Press the shutter button fully to start recording.
   - The focus and zoom are locked during recording.
   - The orange lamp beside the viewfinder blinks while the movie is recorded in the internal memory or card.
   - During movie recording, lights red.

This sample page is only for your reference. It may differ from the actual page in this manual.
Tips before you start taking pictures

Your pictures are almost guaranteed to come out well just by setting the mode dial to **AUTO** or **P** and pressing the shutter button. But occasionally, you can’t focus on your subject, or the subject is too dark, or the picture doesn’t come out the way you want…

Just knowing which button to press or which setting to change can help you solve these problems.

And did you know that by selecting an image size according to how you plan to use the pictures afterwards, you can store more pictures on the memory card? These are just some of the hints provided in this chapter.
Holding the camera

Sometimes when you look at a picture you have taken, the contours of the subject are blurred. This is often caused by movement of the camera at the precise moment that the shutter button is pressed.

![Picture where subject is not clearly defined](image)

To prevent the camera from moving, hold the camera firmly with both hands while keeping your elbows at your sides. When taking pictures with the camera in the vertical position, hold the camera so that the flash is positioned higher than the lens. Keep your fingers and the strap away from the lens and flash.

- **Horizontal grip**
- **Vertical grip**

</tr>
<tr>
<td><strong>Disadvantages</strong></td>
<td>Camera movement occurs easily and subjects may be difficult to see in bright/dark places. The monitor uses more battery power than the viewfinder.</td>
<td>When close to a subject, the image in the viewfinder differs slightly from the picture that the camera actually records.</td>
</tr>
<tr>

<td>Use the monitor when you need to know the exact area the camera records, or to take a close-up of a person or flower (macro shooting).</td>
<td>Use the viewfinder for general snapshots, landscape pictures and other casual shots.</td>
</tr>
</tbody>
</table>

Viewfinder

- The camera records a wider area than the image in the viewfinder.
- As you get closer to the subject, the actual image recorded (the shaded area in the illustration on the left) differs slightly from the image in the viewfinder.

**TIPS**

To turn the monitor off and take pictures using the viewfinder

→ In shooting mode, press to display the top menu, and press . The monitor turns off. Repeat the steps to turn the monitor on.

When the monitor turns off automatically

→ If the camera is not used for over 3 minutes, the monitor turns off automatically. To turn the monitor on, press or the shutter button.

To adjust the brightness of the monitor

→ Adjust the brightness with the settings. “Adjusting the brightness of the monitor” (P. 89)

When the monitor is hard to see

→ Bright light, such as direct sunlight, may cause vertical lines (smears) to appear on the image in the monitor. This does not affect recorded pictures.
If correct focus cannot be obtained

The camera automatically detects the focus target in the frame. The level of contrast is one of the criteria it uses to detect the subject. The camera may fail to determine subjects with lower contrast than the surroundings or with an area of extremely strong contrast in the frame. If this happens, the simplest solution is to use the focus lock.

How to focus (focus lock)

1. **Position the AF target mark on the subject you want to focus on.**
   - When shooting a hard-to-focus or fast-moving subject, focus the camera on an object about the same distance away as the subject.

2. **Press the shutter button halfway until the green lamp lights.**
   - When the focus and exposure are locked, the green lamp lights.
   - The AF target mark moves to the focus position.
   - When the green lamp blinks, the focus and exposure are not locked. Release your finger from the shutter button, re-position the AF target mark on the subject and press the shutter button halfway again.

3. **Keeping the shutter button pressed halfway, recompose your shot.**
4 Press the shutter button fully.

Subjects that are difficult to focus on

Under certain types of conditions, the auto focus may not work properly.

- The green lamp blinks. The subject cannot be brought into focus.
  - Subject with low contrast
  - Subject with an extremely bright area in the center of the frame
  - Subject without vertical lines

- The green lamp lights, but the subject cannot be brought into focus.
  - Subjects at different distances
  - Fast-moving subject
  - The subject is not in the center of the frame

In these cases, focus (focus lock) on an object with high contrast at the same distance as the intended subject, recompose your shot and then take the picture. If the subject has no vertical lines, hold the camera vertically and focus the camera using the focus lock function by pressing the shutter button halfway, then return the camera to the horizontal position while keeping the button pressed halfway and take the picture.
Record mode

You can select a record mode in which to take pictures or shoot movies. Select the best record mode for your purpose (printing, editing on a computer, website editing, etc.). For information on the image sizes for each record mode and memory capacity, see the table on P. 28.

Still picture record modes

Record mode depicts the image size and compression rate of pictures you wish to record. Pictures are made from thousands of dots (pixels). If a picture with relatively few pixels is enlarged, it looks like a mosaic. A picture with many pixels is denser and clearer, but requires a larger file size (data size), decreasing the number of pictures that can be saved. Increasing the compression rate reduces the file size, but makes the pictures appear grainy.

Image size
The number of pixels (horizontal × vertical) used when saving an image. Save your pictures in a large image size to get clearer prints.

Compression
Image data is compressed and recorded. The higher the compression, the less clear the image will be.
Movie record modes

Movies are recorded in Motion-JPEG format.

</table>

**TIPS**

- When a picture is transferred to a computer, the size of the picture on the computer screen varies depending on the computer’s monitor setting. For instance, a picture taken with an image size of 1,024 × 768 fills the screen if you set the picture to 1× when the monitor setting is 1,024 × 768. However, if the monitor setting is over 1,024 × 768 (such as 1,280 × 1,024), the picture only takes up part of the screen.
Note

- The number of storable still pictures and remaining recording times listed in the table are approximate.
- The number of storable still pictures may change according to the subject or factors like whether print reservations have been made or not. In certain instances, the number of remaining pictures does not change even when you take pictures or stored images are erased.
- If movies are shot with [VIDEO OUT] set to [PAL] and the AV cable connected, the movie recording time will differ from the time listed in the “Number of storable still pictures/remaining recording time” table.

Recording pictures

Pictures taken are stored in the internal memory. You can also use an optional xD-Picture Card (referred to as “card” in this manual) to store pictures. The card has greater capacity than the internal memory, and so is able to store more pictures. The card is convenient, for example, when you are traveling and you want to take a lot of pictures.

**Internal memory basics**

The internal memory corresponds to the film of a normal camera for recording pictures you have taken. Pictures recorded and stored in the internal memory can easily be erased, overwritten, and/or edited on a computer. The internal memory cannot be replaced or removed from the camera.

**Relationship between the internal memory and the card**

The monitor displays which memory (internal or card) is being used for shooting and displaying images.

### Shooting mode

- **[IN]** Stores to the internal memory.

### Playback mode

- **[IN]** Plays the pictures stored in the internal memory.
- **[xD]** Stores to the card.
- **[xD]** Plays the pictures stored on the card.

- You can copy all the image data stored in the internal memory to a card.
  - “Copying pictures to a card (BACKUP)” (P. 76)
Using a card (optional)

An optional card is available for this camera.

Card basics

The card corresponds to the film of a normal camera for recording the pictures you have taken. Pictures recorded and stored on the card can easily be erased, overwritten, and/or edited on a computer. Using a card with larger capacity increases the number of pictures you can record.

1. Index area
   You can use this space to write the contents of the card.
2. Contact area
   The part where the data transferred from the camera enters the card.

Compatible cards

- xD-Picture Card (16 to 512 MB)

Note

- This camera may not recognize a non-Olympus card or a card that was formatted on another device (computer, etc.). Before use, be sure to format the card on this camera. “Formatting” (P. 79)

Inserting a card

1. Make sure the camera is turned off.
   - The monitor is off.
   - The green lamp and the orange lamp beside the viewfinder are off.
   - The lens is retracted.

Orange lamp
Monitor
Green lamp
2 Open the card cover.

3 Open the card lock.

**Inserting the card**

4 Orient the card as shown, and insert it into the card slot as shown in the illustration.
   - Insert the card while keeping it straight.
   - The card stops with a click when it is inserted fully.
   - Inserting the card the wrong way or at an angle could damage the contact area or cause the card to jam.
   - If the card is not inserted fully, data may not be written to the card.
Removing the card

4 Push the card all the way in and release slowly.
   • The card protrudes slightly and stops.

   Caution
   Releasing your finger quickly after pushing the card all the way in may cause it to eject forcefully out of the slot.

   • Grasp the card and remove.

5 Close the card lock.
   • Close the card lock or else the card cover does not close.

6 Close the card cover.
Basic shooting functions

A professional photographer adjusts the exposure to the optimal setting, chooses the best focusing method and even selects the type of film according to the subject. With a digital camera, you don’t need to learn how to make difficult settings. Your camera will adjust the settings for you! All you have to do is choose a scene mode according to whether you are taking a landscape, a night scene, a portrait-style image or whatever, and the camera will set the best exposure and white balance. There’s nothing to it – just press the shutter button!
Selecting a shooting mode according to the situation

Use the mode dial to switch between shooting modes before taking pictures. You can take pictures with the optimum settings by setting the mode dial according to the shooting conditions or purpose.

**Shooting mode**

**P Program Auto**

Suitable for general situations. The camera automatically uses settings that captures the scene in its natural colors. You can set other functions such as exposure compensation as desired.

**Auto**

Takes pictures in full auto.

**Portrait**

Suitable for taking a portrait-style shot of a person. This mode is optimum for reproducing silky skin tones.

**Landscape**

Suitable for taking pictures of landscapes and other outdoor scenes. Both the foreground and the background are in focus. Since blues and greens are vividly reproduced in this mode, it is excellent for shooting natural scenery.

**Night Scene***

Suitable for shooting pictures in the evening or at night. The camera sets a slower shutter speed than is used in normal shooting. For example, if you take a picture of a street at night in P mode, the lack of brightness will result in a dark picture with only dots of light. In the Night Scene shooting mode, the true appearance of the street is captured. Since the shutter speed is slow, make sure that you stabilize the camera by using a tripod.

**Sports**

Suitable for capturing fast-moving action (such as sports) without blurring. Even fast-moving subjects appear to be stationary.

**Landscape+Portrait**

Suitable for taking pictures of both your subject and the landscape. The picture is taken with the background as well as the subject in the foreground in focus. You can take pictures of your subject against a beautiful sky or landscape.
Selecting a shooting mode according to the situation

**SCENE**

This function allows you to select from 10 situation-related modes set to the shooting conditions.

“Selecting scene modes by subject (SCENE SELECT)” (P. 37)

**Movie**

Records movies. As the focus and zoom are locked while recording, be sure to keep the distance between the camera and subject constant to avoid losing focus. Sound is recorded with the movie.

“Recording movies” (P. 50)

**M Manual**

This function allows you to set the aperture and shutter speed manually.

“Setting the aperture and shutter speed (manual shooting)” (P. 46)

* Noise reduction is automatically enabled when the subject is dark. Processing time between shots is doubled and you cannot take pictures during this time. Also, the picture is slightly larger than normal.

1. Set the mode dial to the desired icon: P, AUTO, , , , , , or SCENE.
   - When the mode dial is set to a mode, the explanation and a sample scene of that mode is displayed momentarily on the monitor.

2. Take the picture.

**TIPS**

- The settings that can be made vary according to each mode. “Modes and shooting functions” (P. 146)
Selecting a shooting mode according to the situation

Selecting scene modes by subject (SCENE SELECT)

By setting the mode dial to SCENE, you can select an additional 10 situation-related modes. Each scene mode features preset settings such as white balance, exposure, and shutter speed, letting you take pictures just by pressing the shutter button.

Scene modes

Self Portrait

Lets you take pictures of yourself while holding the camera. As the camera is set to focus on a subject that is close, the zoom is locked to wide-angle, and cannot be changed.

Indoor

Optimum for taking pictures of gatherings. This mode reproduces the background clearly capturing the atmosphere.

Beach

Optimum for taking pictures at the beach under blue skies. This mode reproduces the colors of the sky, greenery, and people clearly.

Snow

Optimum for taking pictures on the snowfields. This mode reproduces the colors of the sky, greenery, and people clearly.

Fireworks*

Optimum for taking pictures of fireworks in the night sky. Since the shutter speed is slow, stabilize the camera before taking pictures.

Sunset*

Optimum for taking pictures of the setting sun. This mode reproduces reds and yellows vibrantly. Since the shutter speed is slow, stabilize the camera before taking pictures.
Selecting a shooting mode according to the situation

### Cuisine
Optimum for taking pictures of your favorite dishes. This mode clearly reproduces the different colors found in cooking.

### Candle*
Optimum for taking pictures with the ambience that candle light creates. This mode reproduces warm colors. Since the shutter speed is slow, stabilize the camera before taking pictures.

### Behind Glass
Optimum for taking pictures of subjects through glass.

### Available Light Portrait*
This mode lets you take pictures in low light without using the flash. Since the shutter speed is slow, stabilize the camera before taking pictures.

* Noise reduction is automatically enabled when the subject is dark. Processing time between shots is doubled and you cannot take pictures during this time. Also, the picture is slightly larger than normal.

Top menu ➤ [SCENE SELECT]  
“How to use the menus” (P. 16)

1. Press † ‡ to select a scene mode, and press ．
   - When you choose a scene type, a sample scene is displayed on the right of the screen.
You can zoom in on your subject using the optical zoom and digital zoom. With the optical zoom, the image is enlarged on the CCD when the lens magnification is changed, and the image is formed by all the CCD pixels. With the digital zoom, the area at the center of the image captured by the CCD is cropped and enlarged. When you zoom in on a subject, you are essentially taking a small area of the picture and making it bigger. Therefore, the greater the magnification with the digital zoom, the grainier the resulting picture will be.

The following zoom magnifications are available on this camera.

**Optical zoom**  
3× (equivalent to 38 mm to 114 mm on a 35 mm camera)

**Optical zoom × digital zoom**  
Max. 12×

Note that camera movement is likely to occur at higher magnifications.

1. **Press the zoom button.**

   Press W on the zoom button.

   ![Zoom out](image)

   Zoom in:  
   Press T on the zoom button.

   ![Zoom in](image)
Using the digital zoom

To use the digital zoom, set [DIGITAL ZOOM] to [ON].

1. Select [ON], and press .
2. Press T on the zoom button.

The white area of the zoom indicator indicates the optical zoom. If the [DIGITAL ZOOM] is set to [ON], a red area is displayed on the zoom indicator. When you reach the limit of the optical zoom, the digital zoom is enabled.

The cursor moves up and down the zoom indicator according to the zoom magnification. The cursor turns orange when inside the digital zoom area.

Note

- The picture may appear grainy when taken inside the digital zoom range.
- [DIGITAL ZOOM] is not available when the monitor is turned off.
Taking close-up pictures (macro/super macro)

Focusing is usually slow when you get close to a subject (wide-angle: 20 cm/7.9" to 50 cm/19.7"; telephoto: 60 cm/23.6" to 90 cm/35.4"). However, in macro mode focusing is performed quickly.

- This mode lets you shoot from as close as 20 cm/7.9" to your subject (when the optical zoom is at the greatest wide-angle).
- This mode lets you shoot from as close as 2 cm/0.8" to your subject. In the [s] mode, normal shooting is also possible, but the position of the zoom is fixed automatically and cannot be adjusted.

1. Press the \(\text{\textbullet}\) button.
   - The macro settings screen is displayed. “How to use the direct buttons” (P. 13)

2. Select \([\text{\textbullet}\text{\textbullet}]\) or \([s\text{\textbullet}\text{\textbullet}]\), and press \(\text{OK}\).

3. Take the picture.

Note

- If you are close to a subject, the picture in the viewfinder is different from the area that the camera actually records. For macro mode shooting, use the monitor.
- If you use the flash in macro shooting, shadows may be noticeable and the correct exposure may not achieved.
- During super macro shooting, the zoom and flash are not available.
Flash shooting

Select the flash mode best suited to the light conditions and the effect you want to achieve.

Flash working range

W (max.): Approx. 0.2 m to 3.7 m (0.7 ft. to 12.1 ft.)
T (max.): Approx. 0.6 m to 2.1 m (2.0 ft. to 6.9 ft.)

Auto-flash (No indication)

The flash fires automatically in low light or backlight conditions.

Red-eye reduction flash (📸)

The light from the flash may make the subject’s eyes appear red in the picture. The red-eye reduction flash mode reduces this phenomenon by emitting pre-flashes before firing the regular flash.

⚠️ Note

- After the pre-flashes, it takes about 1 second before the shutter is released. Hold the camera firmly, and prevent it from moving.
- Effectiveness may be limited if the subject is not looking directly at the pre-flashes, or if the shooting subject is too far. Individual physical characteristics may also limit effectiveness.

Fill-in flash (📸)

The flash fires regardless of the available light. This mode is useful for eliminating shadows on the subject’s face (such as shadows from tree leaves), in a backlight situation, or for correcting the color shift produced by artificial lighting (especially fluorescent light).

⚠️ Note

- The fill-in flash may not have the desired effect under excessively bright light.

Flash off (🚫)

The flash does not fire even in low light conditions. Use this mode in situations where flash photography is not desired or is prohibited. You can also use this mode when shooting landscapes, sunsets, and other subjects outside the range of the flash.

⚠️ Note

- Since a slow shutter speed is automatically selected in low light situations when in the flash off mode, the use of a tripod is recommended to prevent your pictures from being blurred by camera movement.
1 Press the $ button.
   • The flash mode settings screen is displayed.
   "How to use the direct buttons" (P. 13)
2 Select a flash mode, and press $.
3 Press the shutter button halfway.
   • In conditions where the flash will fire, $ lights (flash stand-by).
4 Press the shutter button fully to take the picture.

? TIPS
The $ (flash charge) mark blinks.
→ The flash is charging. Wait until $ and the orange lamp beside the viewfinder turn off.

! Note
• The flash does not fire in the following situations:
  Sequential shooting, super macro, or panorama.
• [AUTO] and [ ] are not available in M mode.
• The flash may not give you the optimum result in macro mode with the zoom set to wide-angle (W). Check the resulting picture on the monitor.
Basic shooting functions

Adjusting picture brightness (exposure compensation)

This function allows you to make fine changes to the exposure setting. You can adjust the exposure in the range of ±2.0 EV in 1/3 EV steps. When the setting is changed, you can check the result on the monitor.

1. Press \( \text{ } \) to select a setting.
   - Plus [+] increases brightness and minus [–] decreases brightness.

2. Take the picture.

   **TIPS**
   - Often bright subjects (such as snow) will turn out darker than their natural colors. Adjust toward + to make these subjects closer to their real shades. For the same reason, adjust toward – when taking dark subjects.
   - In some situations, you may get better results when the exposure that the camera sets is compensated (adjusted) manually.

   **Note**
   - If the flash is used, the image brightness (exposure) may differ from the intended brightness.
   - Exposure compensation cannot correct the image if the surroundings of the subject are extremely bright or dark.
Additional shooting functions

At a sporting event…
Use movie mode to capture the atmosphere by recording the cheers and applause along with the action. Or use sequential shooting mode to take a succession of shots of a goal and pick out the best ones later.

In the country or at a tourist spot…
Use panorama mode* to capture a beautiful mountain range or impressive building.

At a party or family gathering…
Use the self-timer function to take group photos at school reunions or birthday parties.

When you want to add a special effect…
Add a sepia effect to produce an old-fashioned touch, or a black & white effect to produce a clear, sharp image while checking the picture on the monitor.

* Requires Olympus xD-Picture Card sold separately.
Setting the aperture and shutter speed (manual shooting)

You can enjoy taking pictures at different aperture values and shutter speeds.

1 Set the aperture and shutter speed.
   - Switches the aperture value between 2 levels.
   - Sets a faster shutter speed.
   - Sets a slower shutter speed.

Aperture range:
   - Aperture value: F2.8 to F7.0
   - Shutter speed: 15" to 1/2000

Note
   - To avoid camera movement, you are recommended to use a tripod when taking pictures requiring a slow shutter speed.

Selecting light measurement points

Using ESP metering when taking pictures of subjects with strong backlighting may cause the subject to be dark. Use spot metering to get pictures with an accurate reading from the center without being affected by the light from behind.

ESP
   - Meters the center of the monitor and the surrounding area separately. The area in the center of the monitor may appear dark when there is strong backlight.

- Meters only the center of the monitor to determine exposure. A subject can be shot with optimal exposure regardless of the background light.

Taking pictures in low light conditions (ISO)

The higher the ISO value, the greater the camera’s light sensitivity and the better its ability to shoot in low light conditions. However, higher values also introduce electrical noise into the resulting picture, which may give it a grainy appearance.

AUTO  Sensitivity is automatically adjusted according to the light conditions and the subject brightness.

50/100/200/400  With a lower ISO setting, you can shoot clear, sharp images in daylight. With a higher ISO setting, you can shoot in dark places.

1  Select [AUTO], [50], [100], [200], or [400], and press  📷.

⚠️  Note

- [AUTO] is not available in M mode.
- ISO settings are based on the sensitivity of normal camera film. The scale is approximate.
- When [ISO] is set to [AUTO] and you are shooting in dark conditions without a flash, the shutter speed is reduced. In this case, the sensitivity is automatically increased to avoid the risk of camera movement.
- If the subject is too far away for the flash illumination to reach when [ISO] is set to [AUTO], the sensitivity is automatically increased.
Adjusting picture coloration

The color of the subject differs depending on lighting conditions. For instance, when daylight, the setting sun, or tungsten lighting are reflected on white paper, the shade of white produced will be slightly different for each. By setting the white balance, you can achieve more natural-looking colors.

### AUTO
The white balance is adjusted automatically so that colors look natural irrespective of the light source.
- For natural colors under a clear sky.
- For natural colors under a cloudy sky.
- For natural colors under tungsten lighting.
- For natural colors under fluorescent lighting.
- For setting a more precise white balance than is available with other white balance settings. To set the optimum white balance for the shooting conditions, point the camera at a white object under the light source you want to use and adjust the white balance.

   • The white balance is set and the screen returns to the mode menu.

Note

• When setting the white balance by pointing the camera at a sheet of white paper, the correct setting may not be obtained if the light reflected by the paper is too bright or too dark.
• White balance may not be effective under some special light sources.
• After setting a white balance other than [AUTO], play back the picture and check the colors on the monitor.
• When the flash is fired with a white balance setting other than [AUTO], colors may appear different in the resulting picture from the colors you see on the monitor.
• When using situation-related modes, the white balance is automatically set according to each mode.

   • You can use the zoom button to enlarge your subject.

2 Press the shutter button fully to start recording.
   • The focus and zoom are locked during recording.
   • The orange lamp beside the viewfinder blinks while the movie is recorded in the internal memory or card.
   • During movie recording, \( \text{ } \) lights red.

3 Press the shutter button again to stop recording.
   • When the remaining recording time has been used up, recording stops automatically.
   • When there is space in the internal memory or card, the remaining recording time (P. 28) is displayed, and the camera is ready to shoot.

? TIPS

To use the zoom during movie recording
→ Set [DIGITAL ZOOM] to [ON]. \( \text{ } \) “Using the digital zoom” (P. 40)
→ If you set [ ] to [OFF], you can use the optical zoom during movie recording.

Notes for recording long movies
- The camera continues to record the movie until the shutter button is pressed again or the space in the internal memory or card is exhausted.
- A long recorded movie cannot be edited. (P. 69)

Panorama shooting

You can take advantage of panorama shooting with an Olympus xD-Picture Card. Panorama shooting lets you connect pictures with overlapping edges into a single panoramic picture, using the OLYMPUS Master software.

The part of the previous picture where it will be joined to the next picture does not remain in the frame on the edge of the screen. You have to remember what the part in the frame looked like and take the next picture so it overlaps. Compose your shots so that the right edge of the previous picture overlaps with the left edge of the next picture if you are connecting pictures from left to right (or vice versa if you are connecting pictures from right to left).

Note

- If the microphone is farther than 1 m (3.3 ft.) from the subject, sound may not be recorded properly.
- Pictures cannot be taken during sound recording.
- Sound recording is not possible in the following cases:
  - Sequential shooting, panorama, or two-in-one pictures.
  - Sound recording may also pick up camera noises, such as button operations, shutter movement, etc.
- Sound recording may not be possible if there is insufficient space in the internal memory or card.
When shooting in dark places, shutter speeds become slower as there is less light focused on the CCD. During long exposures, signals are generated by parts of the CCD where no light is focused and are recorded on the image as noise. When [NOISE REDUCTION] is set to [ON], the camera automatically reduces the noise to produce clearer images.

Noise is reduced. Shooting time is twice as long as usual. Noise reduction is enabled when the shutter speed is slow.

Noise is not reduced. Noise may be conspicuous with slow shutter speeds.

The purpose of these pictures is to illustrate the effects of noise reduction. They are not actual pictures.

Top menu ▶ [MODE MENU] ▶ [CAMERA] ▶ [NOISE REDUCTION]

1 Select [ON] or [OFF], and press 完.

Note

- [NOISE REDUCTION] is always set to [ON] when the camera is set to or SCENE (  8 ,  9 , 11 , or 12 ).
- When [NOISE REDUCTION] is set to [ON], the camera implements noise-reducing processes after each shot to produce clearer images. However, shooting time is approximately twice as long as usual. During this time, the next shot cannot be taken. Also, the picture is larger than normal. Use the monitor to view what you are taking.
- When [NOISE REDUCTION] is set to [ON], sequential shooting and two-in-one pictures are not possible.
- This function may not work effectively with some shooting conditions or subjects.
With film-type cameras, you cannot see the pictures you have taken until the film has been developed. And aren't you sometimes disappointed with the results when you do eventually see them? Pictures of blurred scenery or someone with their eyes shut. Or maybe you took several pictures of the same scene because you weren't sure whether they would come out or not. That's no way to record important memories! With a digital camera, you can review your pictures immediately. Just play the picture back as soon as you've taken it. If you don't like what you see, erase and take it again. So don't be afraid of pictures not coming out well – just keep on pressing that shutter button!
Playing back still pictures

When a card is in the camera, a picture from the card is displayed. To play back pictures from the internal memory, remove the card.

1. Press ．

Editing still pictures (ADD FRAME/BLACK & WHITE/SEPIA/)

This function lets you edit still pictures and save them as new pictures. The following editing operations are possible.

**ADD FRAME**
This function lets you frame pictures with a frame of your choice and saves them as new pictures.

**BLACK & WHITE**
This function lets you save black & white versions of your pictures.

**SEPIA**
This function lets you save sepia versions of your pictures. Changes the image size to 640 × 480 or 320 × 240 and saves the picture as a new file.

- [BLACK & WHITE], [SEPIA], \( \text{Q} \), and [ADD FRAME] are not available in the following cases:
  - Movies, pictures that have been edited on a computer, pictures taken with another camera, or when there is insufficient space in the internal memory or card.
  - When a frame is added, the picture is saved at an image size of 1,584 × 1,056. Adding a frame to a picture taken in SQ2 causes the picture to appear grainy.
Adding sound to still pictures

Sound can be added to a still picture that you have already taken. (This is known as “after-recording”.) You can also re-record over the sound that has already been recorded. Total recording time per picture is approximately 4 seconds. Select the still picture to which you want to add sound, and display the top menu.

1. Press \( \text{\textcopyright} \) to display [START].

2. Aim the camera microphone toward the sound you want to record, and press \( \text{\textcopyright} \) to start recording.
   - The [BUSY] bar is displayed during recording.

Note
- If the microphone is farther than 1 m (3.3 ft.) from the subject, sound may not be recorded properly.
- If you re-record the sound, the original sound is erased.
- You cannot record sound when there is insufficient space in the internal memory or card.
- The microphone may pick up the sound of buttons operated.
- Once sound is added to a picture, it is not possible to erase only the sound. In this case, make a re-recording with silence.

Playing back pictures on a TV

Use the AV cable provided with the camera to play back recorded images on your TV. You can play back both still pictures and movies on your TV.

1. Make sure that the TV and camera are turned off. Connect the multi-connector on the camera to the video input terminal on the TV using the AV cable provided with the camera.

   - Connect to the TV’s video input (yellow) and audio input (white) terminals.

   - AV cable (provided)

2. Turn the TV on, and set it to the video input mode.
   - For details of switching to video input, refer to your TV’s instruction manual.

3. Press $ to turn the camera on.
   - The last picture taken is displayed on the TV. Use the arrow pad to select the picture you want to display.

   - TIPS
     - You are recommended to use the optional AC adapter when playing back pictures on a TV.
     - The close-up playback, index display and [m] functions can also be used on a TV screen.

   - Note
     - Make sure that the camera’s video output signal is the same as the TV’s video signal. “Selecting the video output” (P. 73)
     - The camera’s monitor turns off automatically when the AV cable is connected to the camera.
     - Be sure to use the AV cable provided to connect the camera to the TV.
     - The picture may appear off-center on the TV screen.
Selecting the video output

You can select [NTSC] or [PAL] according to your TV’s video signal type. Use this setting when playing back pictures on a TV in a foreign country. Select the [VIDEO OUT] signal before connecting the AV cable. If you select the wrong video signal type, you will not be able to play back the recorded pictures properly on the TV.

Copying pictures to a card (BACKUP)

You can copy (backup) all the image data stored in the internal memory to the card. The image data in the internal memory is not erased by copying it to the card.

The optional card is required to use the backup function. Operate the camera with the card inserted.

Top menu ➤ [MODE MENU] ➤ [CARD] ➤ [BACKUP]

- In [AUTO] : Top menu ➤ [SETUP] ➤ [BACKUP]

1. Select [YES], and press [OK].
   - All image data stored in the internal memory is copied to the card.

Note
- When the card has insufficient memory, [CARD FULL] is displayed, and copying is canceled.
- When the mark is blinking, pictures cannot be backed up because of insufficient battery power.
- If the battery power is exhausted while copying, the image data may be lost or damaged. You are recommended to use the AC adapter.
- Never open the card cover, remove the batteries, or connect or disconnect the AC adapter during copying as this may cause malfunction of the internal memory or the card.
Erasing pictures

This function erases recorded pictures. Pictures can be erased either one at a time or all the pictures in the internal memory or card at once.

- When you want to erase pictures in the internal memory, do not insert the card.
- Insert the card when you want to erase pictures on the card.

![Note]

- You cannot erase protected pictures. Cancel protection before erasing such pictures.
- Once erased, pictures cannot be restored. Check each picture before erasing to avoid accidentally erasing pictures you want to keep. See “Protecting pictures” (P. 75)

Single-frame erase

1. Select the picture you want to erase, and press the \( \text{\textregistered} \) button.
   - The \( \text{\textregistered} \) ERASE] screen is displayed.
     - See “How to use the direct buttons” (P. 13), “Playing back still pictures” (P. 61)

2. Select [YES], and press \( \text{\textregistered} \).

  Open the card cover or battery compartment cover, or connect or disconnect the AC adapter (regardless of whether there are batteries in the camera or not).
Settings

One of the key features of a digital camera is that you can view the pictures you have taken immediately. But that isn’t all. For example, you can set the startup screen so that one of the pictures you have taken is displayed when you turn the camera on. That’s originality for you! And if you lend the camera to friends from abroad, you can select the appropriate language for on-screen display. Making use of these functions will make such a difference to how much fun you get out of your camera. Why not try them out?

Saving camera settings (ALL RESET)

This function lets you choose whether or not to save the current camera settings after the power is turned off. The settings affected by [ALL RESET] are listed below.
The [ALL RESET] setting ([ON]/[OFF]) applies to all modes. It applies whether the camera is in shooting mode or playback mode.

ON  All settings are returned to the factory default settings after the power is turned off (initial settings).
Example: If [ALL RESET] is set to [ON] and [QUIT] is changed to [SQ1], [QUIT] returns to the factory default setting ([HQ]) when the camera is turned on again.

OFF  The settings made before the power is turned off are saved.

**RESET** The file number and folder number are reset every time a new card is inserted in the camera. The folder number returns to No. 100 and the file number returns to No. 0001. This method is useful when grouping files on separate cards.

**AUTO** Even if a new card is inserted, the folder number and file number are retained from the previous card, so the same file number is not used on different cards. This helps you to manage multiple cards. This method is useful when you want to manage all your files with sequential numbers.

Note

• The date and time settings return to the factory default settings if the camera is left without batteries for approximately 3 days. The settings will be canceled more quickly if batteries were only loaded in the camera for a short time before being removed. Before taking important pictures, check that the date and time settings are correct.
• If the date and time setting is canceled, a warning is displayed on the monitor the next time the camera is turned on. “Error codes” (P. 122)
Printing pictures

You can print out the pictures you have taken either at a photo store or at home on your own printer.
If you go to a photo store, it is a good idea to store the print reservation data on the card first. This lets you select the pictures you want to print and decide how many prints you want.
If you print the pictures at home, you can either connect the camera directly to the printer or you can connect the camera to a computer and download the pictures to the computer first.
Direct printing (PictBridge)

Using the direct printing function

By connecting the camera to a PictBridge-compatible printer with the USB cable, you can print out recorded pictures directly. With the camera connected to the printer, select the pictures you want to print and the number of prints on the camera's monitor. It is also possible to print out pictures using the print reservation data. Use “Print settings (DPOF)” (P. 99) To find out if your printer is compatible with PictBridge, refer to the printer’s instruction manual.

What is PictBridge?… It is the standard for connecting digital cameras and printers of different manufacturers and printing out pictures directly.

STANDARD… All printers that support PictBridge have standard print settings. If [STANDARD] is selected on the settings screens (P. 93 to P. 97), images are printed according to these settings. Refer to the printer’s instruction manual for its standard settings or contact the printer manufacturer.

TIPS

• For details of printing paper types, ink cassettes, etc., refer to the printer’s instruction manual.

Note

• You are recommended to use the optional AC adapter when printing pictures. If you use batteries, make sure they have enough power. If the camera stops operating while communicating with the printer, the printer may malfunction or image data may be lost.
• Movies cannot be printed.
• The camera does not enter sleep mode when connected to the printer by the USB cable.

Print modes and settings

Available printing modes, paper sizes etc., vary depending on the printer you use. Refer to the instruction manual for your printer.
Printing pictures

Use the USB cable provided to connect the camera to a PictBridge-compatible printer. The basic printing method for printing one picture is shown below. One print of your selected picture will be printed using the standard settings of your printer. The date and file name are not printed.

1 Turn the printer on and plug the printer end of the USB cable into the printer’s USB port.
   • For details of how to turn the printer on and the position of the USB port, refer to the printer’s instruction manual.

2 Plug the USB cable into the camera’s multi-connector.
   • The camera turns on automatically.
   • The monitor turns on and the selection screen for the USB connection is displayed.

3 Select [PRINT], and press OK.
   • [ONE MOMENT] is displayed and the camera and printer are connected. The [PRINT MODE SELECT] screen is displayed on the monitor. Make the print settings on the camera’s monitor.

4 Select [PRINT], and press OK.
   • The [PRINTPAPER] screen is displayed.
5 Press \( \text{OK} \) without changing the [SIZE] or [BORDERLESS] settings.
   - When the [PRINTPAPER] screen is not displayed, go to Step 6.

6 Press \( \text{OK} \) to select the picture you want to print, and press \( \text{OK} \).
   - The [PRINT] screen is displayed.

7 Select [OK], and press \( \text{OK} \).
   - Printing starts.
   - When printing is finished, the [PRINT MODE SELECT] screen is displayed.

To cancel printing
Pressing \( \text{OK} \) during print data transfer displays the screen for selecting whether to continue or cancel printing. To cancel printing, select [CANCEL], and press \( \text{OK} \).

Screen during data transfer
8 In the [PRINT MODE SELECT] screen, press ◀.  
• A message is displayed.

9 Remove the USB cable from the camera.  
• The camera turns off.

10 Remove the USB cable from the printer.

Note  
• When the [USB] mode is set to [PC], the [PRINT MODE SELECT] screen is not displayed in Step 4. Disconnect the USB cable, and repeat the procedure from Step 1.
Other print modes and print settings

There are many other print modes available besides the basic mode. Even within the same mode, you have the choice of setting a border or the paper size.

Follow the operation guide for the screens shown below.

Selecting a print mode

**PRINT**

**TIPS**

- If an error code other than those shown above is displayed, see “Error codes” (P. 122).
How to make print reservations

Print reservation allows you to save printing data (the number of prints and the date/time information) with the pictures stored on the card.

Only pictures stored on the card can be reserved to print. Insert a card with recorded pictures into the camera before making print reservations.

With print reservation, you can print out pictures easily either at home using a personal DPOF-compatible printer or at a photo store that supports DPOF. DPOF is a standard format used to record automatic print information from digital cameras. You can print out pictures automatically, at home or at a photo store, by storing data, such as which pictures you want to print and the number of prints, on the card.

Pictures with print reservations can be printed using the following procedures.

**Printing using a DPOF-compatible photo store.**
You can print the pictures using the print reservation data.

**Printing using a DPOF-compatible printer.**
Printing is possible directly from a card containing print reservation data without using a computer. For more details, refer to the printer’s instruction manual. A PC card adapter may also be necessary.

---

To use print services without using DPOF

Pictures stored in the internal memory cannot be printed at a photo store. The pictures need to be copied to a card before taking them.

“Copying pictures to a card (BACKUP)” (P. 76)
TIPS

Relation between printing and record mode when shooting
The resolution of a computer/printer is generally based on the number of dots (pixels) per inch (dpi). Increasing the dpi when printing a picture produces a finer print. However, as the resolution of the picture is not changed, the size of the print will be smaller. You can enlarge the size of the print, but the picture will appear grainy.
If you want to print large, high-quality pictures, set the record mode as high as possible when taking the pictures. “Record mode” (P. 27)

Note

• DPOF reservations set by another device cannot be changed by this camera. Make changes using the original device.
• If a card contains DPOF reservations set by another device, entering reservations using this camera may overwrite the previous reservations.
• If there is not enough space in the card memory, you may not be able to enter the reservation data. [CARD FULL] will be displayed.
• You can make DPOF print reservations for up to 999 images per card.
• Even if an image is displayed with the message [PICTURE ERROR], it may be possible to make print reservations. In this case, the print reservation icon () is not displayed when the image is displayed for full view. () is displayed when there are multiple images (index display), allowing you to confirm the print reservation.
• Not all functions may be available on all printers, or at all photo stores.
• Print reservation may take a little time when saving printing data to a card.

Connecting the camera to a computer

Viewing the pictures you have taken on your computer is just one of the many ways you can enjoy your pictures. You can print out your favorite pictures, use the application software to download your pictures from your camera and edit them or arrange them by date or category, or attach them to e-mail and send them over the Internet.

There are all kinds of ways you can use your pictures with a computer. You can run a slideshow, post your pictures on your home page, create an album, or set your favorite picture as your desktop wallpaper.
Flow

Using the USB cable provided with your camera, you can connect the camera and computer and download (transfer) the images to your computer using the OLYMPUS Master software, also provided with the camera.

Prepare the following items before starting.

- Install the OLYMPUS Master software  P. 108
- Connect the camera to the computer using the USB cable  P. 112
- Start up the OLYMPUS Master software  P. 113
- Download image files to the computer  P. 115
- Disconnect the camera from the computer  P. 116

**TIPS**

**Viewing and editing downloaded images**

→ If you want to process images using graphics applications, make sure you download the images to your computer first. Depending on the software, the image files may be damaged if the images are processed (rotated, etc.) while they are still in the internal memory or on the card.

**If the data cannot be downloaded from the camera using the USB cable**

→ Image files on xD-Picture Card may be downloaded using the optional PC card adapter. For details, visit the Olympus web site at the address shown on the back cover of this manual.

**Note**

- It is recommended that you use the optional AC adapter when connecting the camera to a computer. If you use batteries, make sure they have enough power. The camera does not turn off automatically while it is connected to (communicating with) a computer. If the battery power runs out, the camera will stop whatever operation it is performing. This may result in a computer malfunction, or loss of image data (file) being transmitted.
- Do not turn the camera off while it is connected to the computer. Doing so could cause the computer to malfunction.
- Connecting the camera to a computer via a USB hub may cause unstable operation if there is any problem with compatibility between the computer and the hub. In this case, do not use a hub, but connect the camera directly to the computer.
Using OLYMPUS Master

For editing and managing image files, install the OLYMPUS Master software from the provided CD-ROM.

What is OLYMPUS Master?

OLYMPUS Master is application software for editing images taken with a digital camera on a computer. Installing it on your computer lets you do the following:

- **Download images from the camera or other media**
- **View images and movies**
  - You can run a slideshow and play back sound.
- **Manage images**
  - You can organize your images using the calendar display. Search the image you want by date or keyword.
- **Edit images**
  - You can rotate images, trim them and change the size.
- **Edit images with the filter and correction functions**
- **Make panoramic images**
  - You can make panoramic images using pictures taken in panorama mode.
- **Print images**
  - You can print images and make indexes, calendars and postcards.

For details of functions and operations other than the above, refer to the “Help” guide and OLYMPUS Master reference manual.
Installing OLYMPUS Master

Before installing the OLYMPUS Master software, please confirm that your computer is compatible with the following system requirements. For newer operating systems, please refer to the Olympus web site as shown on the back cover of this manual.

Connecting the camera to a computer

This camera is compatible with USB mass storage. You can connect the camera to your computer using the USB cable provided with the camera to download and save images without using OLYMPUS Master. The following environment is required to use the USB cable to connect the camera to your computer.

**Windows**: Windows 98SE/Me/2000 Professional/XP

**Macintosh**: Mac OS 9.0 to 9.2/X

**Note**

- If your computer is running Windows 98SE, you will need to install the USB driver. Before connecting the camera to your computer with the USB cable, double-click the files from the following folders on the OLYMPUS Master CD-ROM provided.
  (Drive name):\USB\INSTALL.EXE
- Data transfer is not guaranteed in the following environments, even if your computer is equipped with a USB port.
  - Windows 95/98/NT 4.0
  - Windows 98SE upgrades from Windows 95/98
  - Mac OS 8.6 or earlier (However, data transfer is confirmed on Mac OS 8.6 equipped with a factory-installed USB port and USB MASS Storage Support 1.3.5.)
  - Computers with a USB port added by means of an extension card, etc.
  - Computers without a factory-installed OS and home-built computers.

7 Click “Print”.
- Printing starts.
- To return to the main menu, click “Menu” in the “Photo Print” window.
Appendix

This chapter contains useful information from OLYMPUS. Here you will find what to do when you are stuck or don’t understand the meaning of the terms used in this manual. Refer to this section for basic troubleshooting, camera care and a full glossary to understanding the terms used in this manual.

Camera care

**Cleaning the camera**

**Exterior:**
- Wipe gently with a soft cloth. If the camera is very dirty, soak the cloth in mild soapy water and wring well. Wipe the camera with the damp cloth and then dry it with a dry cloth. If you have used the camera at the beach, use a cloth soaked in clean water and wrung well.

**Viewfinder and monitor:**
- Wipe gently with a soft cloth.

**Lens:**
- Blow dust off the lens with a commercial blower, then wipe gently with a lens cleaner.

---

**Note**

- Do not use strong solvents such as benzene or alcohol, or chemically treated cloth.
- Mold may form on the lens surface if the lens is left dirty.

---

**Storage**

- When storing the camera for extended periods, remove batteries, AC adapter and card, and keep in a cool, dry place that is well ventilated.
- Periodically insert batteries and test the camera functions.

---

**Note**

- Avoid leaving the camera in places where chemical products are handled since this may result in corrosion.
AC adapter (optional)

An AC adapter is useful for time-consuming tasks such as image downloads to a computer. An optional Olympus AC adapter allows you to power your digital camera from a common AC wall outlet.

**TIPS**

- When the AC adapter is connected, the power is drawn from the AC adapter even if there are batteries in the camera. The batteries are not recharged.

**Note**

- Do not connect or disconnect the AC adapter while the camera is turned on. Doing so could affect the camera’s internal settings or functions.
- Be sure to read the instruction manual for the AC adapter.
Safety Precautions

Caution for Usage Environment

- To protect the high-precision technology contained in this product, never leave the camera in the places listed below, no matter if in use or storage:
  - Places where temperatures and/or humidity are high or go through extreme changes. Direct sunlight, beaches, locked cars, or near other heat sources (stove, radiator, etc.) or humidifiers.
  - In sandy or dusty environments.
  - Near flammable items or explosives.
  - In wet places, such as bathrooms or in the rain. When using products with weatherproof designs, read their manuals as well.
  - In places prone to strong vibrations.
- Never drop the camera or subject it to severe shocks or vibrations.
- When mounted on a tripod, adjust the position of the camera with the tripod head. Do not twist the camera.
- Do not touch electric contacts on cameras.
- Do not leave the camera pointed directly at the sun. This may cause lens or shutter curtain damage, color failure, ghosting on the CCD, or may possibly cause fires.
- Do not push or pull severely on the lens.
- Before storing the camera for a long period, remove the battery. Select a cool, dry location for storage to prevent condensation or mold from forming inside the camera. After storage, test the camera by turning it on and pressing the shutter release button to make sure that it is operating normally.
- Always observe the operating environment restrictions described in the camera’s manual.

Battery Handling Precautions

- Olympus NiMH batteries (included in some areas) are intended for use only with Olympus digital cameras. Never use these batteries with any other device.
- Always charge NiMH batteries (included in some areas) before using them for the first time, or if they have not been used for a long period.
- Always charge sets of batteries (included in some areas) (2 or 4) together.
- Do not use alkaline batteries unless it is absolutely necessary. In some cases, alkaline batteries may have a shorter service life than NiMH or CR-V3 lithium battery packs. Alkaline battery performance is limited, especially at low temperatures. The use of NiMH batteries is recommended.
- AA manganese (Zinc-Carbon) batteries cannot be used with this camera.
- When operating the camera with battery power at low temperatures, try to keep the camera and spare batteries as warm as possible. Batteries which run down at low temperatures may be restored after they are warmed at room temperature.
Safety Precautions

• Recommended temperature ranges for NiMH batteries:
  Operation .................. 0°C to 40°C (32°F to 104°F)
  Charge ..................... 0°C to 40°C (32°F to 104°F)
  Storage ..................... -20°C to 30°C (-4°F to 86°F)

• Using, charging, or storing the batteries outside these ranges could shorten battery life or affect battery performance. Always unload the batteries from the camera before storing the camera for a long period.

• Before using NiMH or NiCd batteries, always read the provided instructions.

• The number of pictures you can take may vary depending on the shooting conditions or batteries.

• Before going on a long trip, and especially before traveling abroad, purchase an ample supply of extra batteries. The recommended batteries may be difficult to obtain while traveling.

LCD Monitor

• Do not push the monitor forcibly; otherwise the image may become vague, resulting in a Display mode failure or damage to the monitor.

• A strip of light may appear on the top/bottom of the monitor, but this is not a malfunction.

• When a subject is viewed diagonally in the camera, the edges may appear zigzagged on the monitor. This is not a malfunction; it will be less noticeable in playback mode.

• In places subject to low temperatures, the LCD monitor may take a long time to turn on or its color may change temporarily. When using the camera in extremely cold places, it is a good idea to occasionally place it in a warm place. An LCD monitor exhibiting poor performance due to low temperatures will recover in normal temperatures.

• The LCD used for the monitor is made with high-precision technology. However, black spots or bright spots of light may appear constantly on the LCD Monitor. Due to its characteristics or the angle at which you are viewing the monitor, the spot may not be uniform in color and brightness. This is not a malfunction.

FCC Notice

- Radio and Television Interference
  Changes or modifications not expressly approved by the manufacturer may void the user’s authority to operate this equipment. This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation.
  This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications.
  However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
  - Adjust or relocate the receiving antenna.
  - Increase the distance between the camera and receiver.
  - Connect the equipment to an outlet on a circuit different from that to which the receiver is connected.
  - Consult your dealer or an experienced radio/TV technician for help. Only the OLYMPUS-supplied USB cable should be used to connect the camera to USB enabled personal computers (PC).

Any unauthorized changes or modifications to this equipment would void the user's authority to operate.
Glossary of terms

Aperture
The adjustable lens opening which controls the amount of light that enters the camera. The larger the aperture, the shorter the depth of field and the fuzzier the background. The smaller the aperture, the greater the depth of field and the sharper the background. Larger aperture values indicate smaller apertures, and smaller aperture values indicate larger apertures.

CCD (Charge-Coupled Device)
This converts light passing through the lens into electrical signals. On this camera, light is picked up and converted into RGB signals to build a single image.

Contrast Detection Method
This is used to measure the distance to the subject. The camera determines if the image is focused by the level of contrast in the subject.

Conventional Photograph
This refers to recording images using silver halide (the method for recording images in conventional, non-digital photography). This system is in contrast to still video and digital photography.

DCF (Design Rule for Camera File System)
A standard for image files by the Japan Electronics and Information Technology Industries Association (JEITA).

Digital ESP Light Metering
This determines the exposure by metering and calculating the light levels in the center and other areas of the image separately.

DPOF (Digital Print Order Format)
This is for saving desired print settings on digital cameras. By entering which images to print and the number of copies of each, the user can easily have the desired images printed by a printer or print lab that supports the DPOF format.

Eclipsing (Vignetting)
This refers to when an object obscures part of the field of view so that the whole subject is not photographed. Eclipsing also refers to when the lens barrel obscures part of the view seen through the viewfinder. In addition, eclipsing can occur when an incorrect lens hood is used, causing shadowing to appear in the corners of the image.

EV (Exposure Value)
A system for measuring exposure. EV0 is when the aperture is at F1 and the shutter speed is 1 second. The EV then increases by 1 each time the aperture increases by one F stop or the shutter speed increases by one increment. EV can also be used to indicate brightness and ISO.

Exposure
The amount of light used to capture an image. The exposure is determined by the time the shutter is open (shutter speed) and the amount of light that passes through the lens (aperture).
**Glossary of terms**

**Image size**
The size of an image expressed by the number of pixels that make up the image. For instance, a picture taken with an image size of 640 × 480 fills the computer screen when the monitor setting is 640 × 480. However, if the monitor setting is 1,024 × 768, the picture only takes up part of the screen.

**ISO**
A method for indicating film speed by the International Organization for Standardization (ISO) (ex. “ISO100”). Higher ISO values indicate greater sensitivity to light, so images can be exposed even in low-light conditions.

**JPEG (Joint Photographic Experts Group)**
A compression format for still images. Photographs (images) shot using this camera are recorded in JPEG format. By downloading these images to a computer, users can edit them using graphics application software or view the images using an Internet web browser.

**M (Manual) Mode**
The user sets both the aperture and shutter speed.

**NTSC (National Television Systems Committee) / PAL (Phase Alternating Line)**
Television formats. NTSC is mainly used in Japan, North America and Korea. PAL is mainly used in Europe and China.

**PictBridge**
A standard for connecting digital cameras and printers of different makers and printing out pictures directly.

**Pixels**
A pixel is the smallest unit (dot) used to make up an image. Clear large-sized printed images require millions of pixels.

**P (Program) Mode**
Also called Program AE mode. The camera automatically sets the best shutter speed and aperture for the shot.

**Sleep Mode**
A mode designed to save battery life. The camera automatically enters the sleep mode if you do not operate it for a certain time. To exit the sleep mode, use any button on the camera (shutter button, arrow pad, etc.).

**TFT (Thin-Film Transistor) Color Monitor**
A transistor color monitor constructed using thin-film technology.

**TTL (Through-The-Lens) System**
To help adjust exposure, a light receptor built into the camera directly measures the light passing through the lens.
This chapter contains all the camera functions described in Chapters 1 to 8. Refer here for the names of the camera parts and buttons, the names and meanings of the icons that are displayed on the monitor, and the lists of the top menus and mode menus. An index also helps you find the pages where a function or item that you are looking for appears.
